Rabies is a fatal animal disease transmissible to humans.

How does it spread?

Domestic animals such as dogs, cats, cattle, sheep, goats, horses, and donkeys, and wild animals such as wolves, foxes, jackals, pigs, bears, martens, skunks, weasels, and ferrets can get rabies.

You can get infected with the rabies virus if you have been bitten or scratched by a rabid animal or its infected saliva has made contact with your skin, eyes, mouth, or nose.

CONTACT THE NEAREST HEALTHCARE FACILITY

if you have had such contact with any of these animals.

Stick to vaccination schedule and get vaccinated on time!

If there is anyone in your neighborhood who has been bitten or scratched by or had any contact with a rabid animal, ask them to contact a healthcare facility.

What to do if your pet has rabies?

You may notice changes in your pet's temperament or behavior with heightened shyness, nervousness, and aggression and a strong urge to bite.

Paralysis, difficulty swallowing, drooling and convulsions may also be observed.

Stay away from any pet showing these symptoms and inform the respective directorate of Provincial/District Agriculture and Forestry as soon as possible.

Have your cats and dogs vaccinated against rabies once a year to protect yourself and your pets.
